

HOW TO SEQUENCE A GENOME

Students will list the steps of genome sequencing.

Individually, students will identify one thing that they learned, and one thing that they already knew. In groups of 4-5, students will share their information and make a group list. A class list will be generated based on the information from all the groups.

This exercise will help as a review for concepts covered previously, and it will also highlight new concepts that have been introduced during the tutorial.
